Flash /ActionScrip
Fireworks
SQL Server
Microsoft Office
Adobe Creative Suite
IIS

Intangibles

User Interface Design
Usability Best Practices
Search Engine Optimization
Troubleshooting
Graphic Design
Finding the Creative Solutions
Sincere love of all things web

Work Experience & Major Accomplishments

Multimedia developer (contractor)

12/2011-2/2012

Blue Diesel, Inc.

Westerville, Ohio

Primarily helped in the development of interaction and animation of content made for iPad apps. This content was developed in HTML4/5 and CSS 3. Animations and interactions were built using jQuery.

Sr. Analyst

3/2008-12/2011

Cardinal Health

Dublin, Ohio

Built an online receiving tool for the national network of pharmaceutical distribution centers. This standardized the process of scheduling product deliveries. Created a mechanism for quantifying the quality of delivered product. Provided reporting for management. Saved the time of dock workers and schedulers.

This application featured an easy-to-use interface. The layout was kept consistent, logical and simple, while still appealing to the eye.

Later versions of this application connected with other enterprise systems to provide live information on delivery status, content and other information.

Built an online communication system for off-cycle ordering. This application provided users for a way to communicate between the corporate office and the main distribution center about any non-standard orders. The application was fast, user-friendly and provided real-time communication, while reducing labor costs of performing the same tasks manually

Built and maintained a supplier scorecard. This was a key report, bringing together data from many different sources regarding supplier performance. The scorecard was built with a logical layout, and was easy to read. Virtually any supplier could look at the scorecard and know what it meant with little explanation.

Various other web-based online reporting. These featured a basic list, expandable for more information such as alternative items using jQuery.

Web application developer

5/2006 – 11/2007

Xcelerate Media, Inc.

Dublin, Ohio

Redesigned the Xcelerate Media Learning management system (LMS). Upon my arrival the LMS had very limited capability. After my first major revision the system received the following enhancements:

- Capability to host and score infinite e-learning courses increased from one
- Cut the number of lines of code by 40%
- Cut the time to set up a new client from one day to less than two hours
- A new more intuitive and dynamic user interface.

A third revision was completed with a teammate. This update included even more enhancements:

- Online message board
- Faster performance
- More robust scoring capabilities

Designed and developed a client website from user requirements. This Data-driven AJAX site allowed for the sales staff to set up a sales call with a potential customer. They would then display examples of Xcelerate Media products online. The examples were chosen from a list for the specific audience of the potential client.

Aided in the development of Flash-based e-learning courses. These online courses were much like very high-end PowerPoint slides with animation and narration. Each course involved editing Action Script, Recording and editing audio files and sometimes video integration.

Built the corporate website for Hull & Associates (www.hullinc.com). Built from client requirements and a home-page design by another artist, this corporate website was developed with HTML, CSS AJAX and VBScript.

User Interface Developer

1/2001 – 5/2006

Cardinal Health

Dublin, Ohio

Served as webmaster for the public website. This included the development of new web content and maintaining existing pages. One problem that existed was posting news to the website in a timely fashion. This process could take up to forty-five minutes. I developed a system that used our intranet to produce the content, and write it to the public web-server taking the time to publish down to five minutes, thus building a small CMS.

Set a goal of increasing searchability of the website. This included researching, adopting and putting into action early SEO best practices

Worked with the team to provide a consistent and user-friendly interaction experience for the enterprise intranet. This included managing graphics, front-end interaction (JavaScript/AJAX) and collaborating with information architects and coming up with solutions for displaying large amounts of data in limited browser space. This was done in a Java/STRUTS environment. To accomplish this I would generally meet with the stakeholders on the project, gather requirements and provide multiple options in the form of mockups for them to choose the best option.

Prior to the rebranding of Cardinal Health, several subsidiary companies went to market under their own name. It was my responsibility to take all of their localized content and create one Cardinal Health branded website.

During and after the rebranding of Cardinal Health, I was constantly pushing for a return to best-practices on the web to better service the audience viewing our sites.

Andrew Zoric

Developed and maintained an intranet for the PTS Business segment. This intranet included an interactive phone directory, later copied by the corporate intranet. Document sharing, updated news and events and a content management system.

Developed intranet applications for departments such as HR. These data-driven applications provided users with the ability to collaborate on hiring executive level employees.

Web developer

2/2000 – 12/2000

LogiKeep Inc. (TruSecure)

Dublin, Ohio

Developed and maintained the corporate intranet. This is where I learned the meaning of the “killer app”. While this dotcom was growing rapidly, it was the photo gallery of all employees that gained the most interest. People wanted to see who the new employees were. Upon revisions of the intranet new applications were built to aid in job performance.

Aided in the development and maintained the corporate website. In one year the website went through three iterations. Through this process I worked with both independent designers and large marketing firms such as Resource Interactive to collaborate on how the site should work.

Aided in the development of a low-end customer product. While the enterprise edition of LogiKeep’s product was an Outlook-style desktop application, I was very involved in a web-based offering of the same solution.

Freelance web development

2002 – Present

Self-employed

Dublin, Ohio

At various times during the past several years I have worked independently for clients on a per Need basis:

InfiniLube.com

This stylish website features an online catalog of industrial grade lubricants for consumer use.

Fol-Dek.com

By design you are required to request a login for this site. Once inside you are greeted with a very slick jQuery-driven side-scrolling offering for a patent-pending skateboard. The content includes animated flash video demonstration and server-side contact form.

KyArtPainting.com

This artist endeavor features a custom built product catalog, and secure PayPal integration

The LHT Group

I have been hired for several projects for this company. The largest of which was a web-based Benchmark Planning System for a major retail chain. This system allows for promotion/demotion of employees of the individual stores.

Brad Moore.net (retired): please see www.andyzoric.com/moore

Brad was a local musician. This site featured audio clips of some of his original and cover songs and an interactive custom database driven calendar of events

Victorys.com (retired)

This website promoted the downtown nightspot Victory’s (Now Classics Victory’s). The site included two different calendars for the different stages, photo archives for events at the site, and food/drink menus.
